How secure is my job with the introduction of ChatGPT?

By Ethan Reddy

Am I going to lose my job to ChatGPT? No, you won't but ill explain why it's likely it will be integrated into your daily life and work soon.

What is ChatGPT? ChatGPT is an advanced intelligence chat bot which uses OpenAI to take prompts and provide complex responses via a compilation of internet data. For example if I was to ask how to make a point and click game using a given language like python ChatGPT will search its database and respond by grabbing all the given information it has on the language python and the games made with it, after gathering the data it deems best it will break it down in a essay like format which increases readability for the reader and show them the code required to make the game while explaining why it uses that specific code and why. This means that for the most part all it does is search up your questions for you and return that info back in a comfortable and human assisted version.

Knowing what ChatGPT is can usually ease most peoples tensions on its potential to steal their job since although AI and open learning can be very powerful it is still in early stages of development. That said, it can't be understated how useful it can be.

ChatGPT can't take jobs but what it can do is explain hard and complex topics in a readable and helpful way to people who are struggling to understand something. For example it excels at explaining math topics, software features, history, and general things people would watch tutorials on.

Why will it become part of your daily life? Well because although it's unlikely you will use it daily it's very likely as it develops more and more companies will use it to find things like the best marketing techniques, the best ways to teach new recruits, and more general workflow use. Thus it's very likely although it won't be directly part of your day to day it's realistic to assume you will consume media, games, work, software, art dictated by ai like ChatGPT in some way.

Although all information about ChatGPT is common knowledge most people would rather fear it then take the time to read up and understand exactly why they shouldn't be. Seeing the power of something so simple can seem very scary and the first thought people have when they see something they deem smarter or stronger then them is that it will replace them but end up not realizing the skills and knowledge they have is very hard to duplicate. Ai is without a doubt making massive leaps but not more than we as humanity have. The human mind and body is so complex and it's unrealistic that a simple albeit cool thing like ChatGPT will be replacing jobs anytime soon.

The main reason people are unable to understand why their career is safe is because of the complex words and ideas used to explain the software they fear. ChatGPT is amazing but very simple. But it's hard to explain why to someone who doesn't have computer science experience so people just talk about it as it is rather than breaking it down so people know that it's more of a cool novelty then a position taker.

The great fear is AI overtaking but the reason more people over the age of 30 believe this is because they didn't grow up learning basic computer science concepts and they just see a very powerful and skilled AI whereas the younger generation sees a simple chat bot capable of some cool things. ChatGPT is simply not the start of some AI overtaking and even if it was humans are capable of turning off servers, cutting power, etc etc to prevent the whole concept.

In conclusion ChatGPT is amazing software and completely and realistically capable of becoming part of your daily life but is not stealing any jobs anytime soon and definitely not the start of some sort of air uprising to replace humanity.
